Steering-Angle Prediction Results

AutoDrive Team | Harsh Bhardwaj, Shrishti Singh, and Rajat Kandpal

Validation sample

505 frame-aligned predictions, selected every 18th row of the 9,082-frame validation partition. Angular errors are reported in degrees; R^2 and Pearson correlation are dimensionless.

Metric	Result
Mean absolute error (MAE)	22.9616°
Root mean squared error (RMSE)	33.2350°
Mean signed error / bias	+20.9977°
Coefficient of determination (R^2)	-0.8769
Pearson correlation	-0.0404
Predictions within ±5°	9.11%

Angle ranges in the same sample

Quantity	Range
Recorded steering angle	-158.12° to +68.17°
Predicted steering angle	+5.648° to +43.119°

Interpretation. The checkpoint shows poor performance on this sample, with strong positive bias and near-zero correlation. Its negative R^2 indicates performance below the sample-mean prediction baseline.

Reporting scope: systematic validation sample only. These metrics do not describe a complete independent test set or closed-loop vehicle performance.
